PREFACE

The Statistical Office of the Republic of Serbia presents the publication “Estimates of population of the Republic of Serbia by sex, age and type of settlement in the period 2008 – 2012”, which contains the data for the Republic of Serbia, Serbia – North, Serbia – South, on the level of regions, areas and its municipalities.

Population estimates are expressed according to the valid administrative and territorial distribution as of January 1st, June 30th (annual average) and December 31st of the observation year. The mentioned data are significant for social development planning, monitoring of those plans execution, as well as for other analytical needs of the current population policy.

Considering that 2011 Census of population, households and dwellings was not conducted on the territory of AP Kosovo and Metohija, as well as that starting from 1997, the vital statistics data are not available for the mentioned province, and since 2002, also the data on internal migrations, the data for the Republic of Serbia are, in this publication, presented without the data on AP Kosovo and Metohija.

Moreover, in the municipalities of Presevo and Bujanovac, the decreased number in census units' coverage was recorded due to the boycott by the majority of Albanian national community. When making the population estimates for 2011 census year, number of population in these two municipalities was pre-calculated according to data from 2011 Census of population, also involving the data on households from 2012 Census of agriculture and natural and mechanical flow of population in the referent year.

Population in 2008, 2009 and 2010 was estimated on the basis of 2002 Census of population. For the census year 2011, presented are the results of population estimates, calculated on the basis of both censuses (2002 and 2011), while estimates for 2012 were based on 2011 Census.

This publication presents main sex and age structures of population, by type of settlement, and regarding the data expressed on the level of regions, areas and municipalities, presented were only the data on total population by sex, relevant age contingents of population and their shares in total population, as well as main indicators of population ageing, such as average age and ageing index.

METHODOLOGICAL EXPLANATIONS AND NOTES

“Estimates of population of the Republic of Serbia by sex, age and type of settlement, 2008-2012” are made for the Republic of Serbia, Serbia – North and Serbia – South, by the level of regions, areas and its municipalities.

Population in 2008, 2009 and 2010 was estimated on the basis of 2002 Census (as of March 31st 2002). Regarding the census year 2011, presented are the results of population estimates, calculated on the basis of both censuses (2002 and 2011), while population estimates for 2012 were based on 2011 Census that was conducted on September 30th 2011 on the territory of the Republic of Serbia.

In 2011 Census, for determining the total population in particular area, the concept of “usual residence” was applied for the first time. According to this concept, a person’s place of usual residence is the place at which a person alone (in case of one-person household) or with the members of his/her household, spends most of his/her time, i.e. daily night-rest, regardless of his/her legal residence. Thus, the total population of particular place includes persons who have lived in their place of usual residence for a continuous period of at least twelve months before the critical moment of the census, as well as persons who lived in that place for less than twelve months, but with the intention of staying there for at least one year. Refugees from the former SFRY republics and internally displaced persons from AP Kosovo and Metohija are encompassed in total population, in accordance with the same rules.

In compliance with the international recommendations (UN/ Eurostat), in 2002 Census, besides the population in the country, usually resident population also involves citizens of the Republic of Serbia whose work, i.e. stay abroad lasted for less than a year, foreign citizens who, due to work or schooling, reside in our country for more than a year, as well as family members of the persons working in the Republic of Serbia. Refugees from the republics of the former SFRY were enumerated, as all other citizens of Serbia, as the usually resident population.

Apart from the census results, population estimates are based on results of the statistics on live births, deaths and internal displacement of population, processed according to the methodology published in *Methodological materials* of the Statistical Office of the Republic of Serbia (Methodologies and standards, no. 5 and 6/2004 and no. 7/2005). Methodological explanations of the statistical survey on internal migrations are presented in *Methodological materials* from 1989, in book no. 342, valid since 1988.

PROCEDURE OF MAKING POPULATION ESTIMATES

In our statistical practice, the most precise data on population structure by age and sex are obtained in the population census. During the ten – year lasting period between the two censuses, significant changes take place, both regarding total population number and age and sex structures of population. Therefore, population estimates for post – census years are done on the basis of results of population census and results of processed statistics of natural and mechanical population flows. Population estimates are also calculated for the census year, knowing that population censuses are carried out on March 31st, and in 2011, the Census was conducted on September 30th. Thus, the continuity of statistical estimates of population is provided, also including age and sex structure of population for every separate observation year.

In this publication, presented are population estimates by sex, age and type of settlement in the period 2008 – 2012, referring to the territory of the Republic of Serbia.

In the previous publication, “Estimates of population of the Republic of Serbia by sex, age and type of settlement, 2003 – 2007”¹, procedure of making population estimates was explained in details, and the critical moment of the Census was March 31st 2002.

When doing the estimates for 2011 (census year) and 2012 (first post - census year), the following data have been used, on the level of settlements:

- Results of Census on September 30th 2011, by sex and calendar year of birth ($P_{\text{попис}}$);
- Results of processed statistics of births in 2011 and 2012, i.e. number of live births, by sex, in base and in current year (N_{2011} и N_{2012});
- Results of processed statistics of deaths in 2011 and 2012, i.e. number of deaths, by sex and calendar year of birth, in census and in current year (M_{2011} , M_{2012});
- Results of processed statistics of migrations in 2011 and 2012, i.e. number of immigrants and emigrants, by sex and calendar year of birth, in base and in current year (I_{2011} , I_{2012} , i.e. E_{2011} , E_{2012}).

Since Census data relate to September 30th 2011, and estimates to mid - year, in the year of population census, population number was first adjusted to as of January 1st 2011 (P_p).

$$P_p (1. \text{январь } 2011) = P_{\text{попис}} - N_{\text{январь-сентябрь } 2011} + M_{\text{январь-сентябрь } 2011} - I_{\text{январь-сентябрь } 2011} + E_{\text{январь-сентябрь } 2011} \quad (1)$$

P_p – *beginning of the year*

Afterward, calculated was the population as of December 31st 2011 (P_k), i.e. January 1st 2012, on the grounds of natural increase and migrations balance:

$$P_k (31. \text{децембар } 2011) = P_p (1. \text{январь } 2011) + (N_{2011} - M_{2011}) + (I_{2011} - E_{2011}) \quad (2)$$

P_k – *end of the year*

Population estimate for mid – 2011 (June 30th) presents average number of population on January 1st and December 31st, 2011.

$$P_{\text{просек } 2011} = (P_p (1. \text{январь } 2011) + P_k (31. \text{децембар } 2011)) / 2 \quad (3)$$

P – *annual average*

For every separate age year (x), average number of population in 2002 was calculated as follows:

$$P_x (\text{просек } 2011) = (P_p (x+1) + P_k (x)) / 2, \quad (4)$$

for the values $x = 0, 1, 2 \dots 100$ and over.

Population estimates for 2012 are performed on the basis of population estimates of January 1st 2012 and data on natural and mechanical flow of population in 2012. Procedure for making estimates (at the beginning, in the middle and at the end of the year) for 2012, as well as for every current post - census year is the same as the procedure described for the census year, according to the formulae (2), (3) and (4).

When computing population estimates by sex, age and type of settlement, the basis is found in census and vital statistical data on the level of settlement, as the lowest territorial and administrative observation unit and on such estimates, by further respective aggregation, derived are the estimates for the upper levels: municipalities, areas, regions, as well as estimates by sex, age and type of settlement for the Republic of Serbia, Serbia – North and Serbia – South.

MAIN CONTINGENTS AND INDICATORS OF POPULATION

Mean age of population is derived on the basis of the following form (for age interval 0 – 100 years and over, by separate age years):

$$A = (\sum (P_{t,x} * (x+0,5))) / (\sum P_{t,x}),$$

where $P_{t,x}$ presents estimated population in the middle of the observation year (t) of persons aged (x) years.

Ageing population index is a significant indicator whose value indicates the demographic process of population ageing: ageing index with the value of up to 20% of index points shows that population is extremely young, and over 40% index points means that population is old. It is determined according to the ratio of population aged 60 and over and the corresponding number of population aged 0-19, applying the formula:

$$I_{st} = ((P_{t,60+}) / (P_{t,0-19})) * 100$$

Total working age population presents the sum of estimated population of both sexes, aged 15-64. Apart from total working age population, calculated is the percentage, i.e. its share in total estimated population.

$$p_{ru,t} = (P_{ru,t}) / (P_t) * 100$$

Share of female fertile population in total population is computed in the following way:

$$p_{f,t,15-49} = ((P_{f,t,15-49}) / (P_t)) * 100$$

Among main age contingents of population and their shares in total population on the level of areas and municipalities, the following contingents were published: 15-64, 18 and over, 0-6, 7-14 and fertile population aged 15-49.
